T(h)REE STAGES

Water shapes the Waldlabor around the Holderbach in many ways; it permeates the soil, trees and air, forming a constant cycle that drives life. It is not only a source of growth, but also a silent companion of decay. The roots of felled trees soak up the water like a sponge, attracting fungi and insects that further decompose the already dead tree stumps. Not even the chemically treated wood of the bridge can escape these natural processes. This results in a dynamic interplay of wood, water and organisms that keeps the forest in a state of constant change.
